# Assignment Project Exam Help

# NP-Completeness

Add WeChat powcoder

- NP-complete problems

- Unlikely to have polynomial time algorithms to solve them
- What do we do?

Assignment Project Exam Help

- One idea: approximation

<https://powcoder.com>

- Instead of solving them exactly, solve them approximately
  - Sometimes, we might want to use an approximation algorithm even when we can compute an exact solution in polynomial time (WHY?)
- Add WeChat powcoder

# Assignment Project Exam Help

# Approximation Algorithms

Add WeChat powcoder

- Decision versus optimization problems
  - **Decision variant:** “Does there exist a solution with objective  $\geq k$ ?”
    - E.g. “Is there an assignment which satisfies at least  $k$  clauses of a given CNF formula  $\varphi$ ?”
  - <https://powcoder.com>
  - **Optimization variant:** “Find a solution maximizing objective”
    - E.g. “Find an assignment which satisfies the maximum possible number of clauses of a given CNF formula  $\varphi$ .”
  - If a decision problem is hard, then its optimization version is hard too
  - We’ll focus on optimization variants

# Assignment Project Exam Help

# Approximation Algorithms

Add WeChat powcoder

- Objectives

- Maximize (e.g. “profit”) or minimize (e.g. “cost”)

- Given problem instance  $I$

- $ALG(I)$  = solution returned by our algorithm

- $OPT(I)$  = some optimal solution

- Approximation ratio of  $ALG$  on instance  $I$  is

$$\frac{\text{profit}(OPT(I))}{\text{profit}(ALG(I))} \quad \text{or} \quad \frac{\text{cost}(ALG(I))}{\text{cost}(OPT(I))}$$

- **Convention:** approximation ratio  $\geq 1$

- “2-approximation” = half the optimal profit / twice the optimal cost

# Assignment Project Exam Help

# Approximation Algorithms

Add WeChat powcoder

- Worst-case approximation ratio

- Worst approximation ratio across all possible problem instances  $I$

## Assignment Project Exam Help

- $ALG$  has worst-case  $c$ -approximation if for each problem instance  $I$ ...

$$profit(ALG(I)) \geq \frac{1}{c} \cdot profit(OPT(I)) \text{ or}$$

$$cost(ALG(I)) \leq c \cdot cost(OPT(I))$$

Add WeChat powcoder

- By default, we will always refer to approximation ratios in the worst case
- Note: In some textbooks, you might see the approximation ratio flipped (e.g. 0.5-approximation instead of 2-approximation)

# Assignment Project Exam Help

## PTAS and FPTAS

Add WeChat powcoder

- Arbitrarily close to 1 approximations
- **PTAS:** Polynomial time approximation scheme
  - For every  $\epsilon > 0$ , there is a  $(1 + \epsilon)$ -approximation algorithm that runs in time  $\text{poly}(n)$  on instances of size  $n$ 
    - Note: Could have exponential dependence on  $1/\epsilon$
- **FPTAS:** Fully polynomial time approximation scheme
  - For every  $\epsilon > 0$ , there is a  $(1 + \epsilon)$ -approximation algorithm that runs in time  $\text{poly}(n, 1/\epsilon)$  on instances of size  $n$

# Assignment Project Exam Help

## Approximation Landscape

### ➤ An FPTAS

- E.g. the knapsack problem

### ➤ A PTAS but no FPTAS

- E.g. the makespan problem (we'll see)

### ➤ $c$ -approximation for a constant $c > 1$ but no PTAS

- E.g. vertex cover and JISP (we'll see)

### ➤ $\Theta(\log n)$ -approximation but no constant approximation

- E.g. set cover

### ➤ No $n^{1-\epsilon}$ -approximation for any $\epsilon > 0$

- E.g. graph coloring and maximum independent set

Impossibility of better approximations assuming widely held beliefs like  $P \neq NP$

$n$  = parameter of problem at hand

# Assignment Project Exam Help

# Approximation Techniques

Add WeChat powcoder

- Greedy algorithms

- Make decision on one element at a time in a greedy fashion without considering future decisions

## Assignment Project Exam Help

- LP relaxation

- Formulate the problem as an integer linear program (ILP)
- “Relax” it to an LP by allowing variables to take real values
- Find an optimal solution of the LP, “round” it to a feasible solution of the original ILP, and prove its approximate optimality

- Local search

- Start with an arbitrary solution
- Keep making “local” adjustments to improve the objective

Add WeChat powcoder

# Assignment Project Exam Help

# Makespan

Add WeChat powcoder

- Problem

- **Input:**  $m$  identical machines,  $n$  jobs, job  $j$  requires processing time  $t_j$
- **Output:** Assign jobs to machines to minimize makespan

Assignment Project Exam Help

- Let  $S[i]$  = set of jobs assigned to machine  $i$  in a solution

<https://powcoder.com>

- **Constraints:**

- Each job must run contiguously on one machine
- Each machine can process at most one job at a time

Add WeChat powcoder

- Load on machine  $i$ :  $L_i = \sum_{j \in S[i]} t_j$

- **Goal:** minimize the *maximum* load, i.e., makespan  $L = \max_i L_i$

# Assignment Project Exam Help

# Makespan

Add WeChat powcoder

- Even the special case of  $m = 2$  machines is already NP-hard by reduction from PARTITION

- PARTITIONAssignment Project Exam Help
  - Input: Set  $S$  containing  $n$  integers
  - Question: Does there exist a partition of  $S$  into two sets with equal sum? (A partition of  $S$  into  $S_1, S_2$  means  $S_1 \cap S_2 = \emptyset$  and  $S_1 \cup S_2 = S$ )

- Add WeChat powcoder
- Exercise!
    - Show that PARTITION is NP-complete by reduction from SUBSET-SUM
    - Show that Makespan with  $m = 2$  is NP-complete by reduction from PARTITION

# Assignment Project Exam Help

# Makespan

Add WeChat powcoder

- Greedy list-scheduling algorithm
    - Consider the  $n$  jobs in some “nice” sorted order
    - Assign each job  $j$  to a machine with the smallest load so far
  - Note: Implementable in  $O(n \log m)$  using priority queue
  - Back to greedy...?
    - But this time, we can't hope that greedy will be optimal
    - We can still hope that it is approximately optimal
  - Which order?
- <https://powcoder.com>
- Add WeChat powcoder

# Assignment Project Exam Help

# Makespan

Add WeChat powcoder

- Theorem [Graham 1966]
  - Regardless of the order, greedy gives a 2-approximation.
  - This was one of the first worst-case approximation analyses

Assignment Project Exam Help

- Let optimal makespan =  $L^*$   
<https://powcoder.com>
- To show that makespan under the greedy solution is not much worse than  $L^*$ , we need to show that  $L^*$  cannot be too low  
Add WeChat powcoder

# Assignment Project Exam Help

## Makespan

Add WeChat powcoder

- Theorem [Graham 1966]
  - Regardless of the order, greedy gives a 2-approximation.
- Fact 1:  $L^* \geq \max_j t_j$ 
  - Some machine must process job with highest processing time
- Fact 2:  $L^* \geq \frac{1}{m} \sum_j t_j$ 
  - Total processing time is  $\sum_j t_j$
  - At least one machine must do at least  $1/m$  of this work (the pigeonhole principle)

# Assignment Project Exam Help

# Makespan

Add WeChat powcoder

- Theorem [Graham 1966]

- Regardless of the order, greedy gives a 2-approximation.

- Proof: Assignment Project Exam Help

- Suppose machine  $i$  is the bottleneck under greedy (so  $L = L_i$ )

- Let  $j^*$  be the last job scheduled on machine  $i$  by greedy

- Right before  $j^*$  was assigned to  $i$ ,  $i$  had the smallest load

- Load of the other machines could have only increased from then

- $L_i - t_{j^*} \leq L_k, \forall k$

- Average over all  $k$  :  $L_i - t_{j^*} \leq \frac{1}{m} \sum_j t_j$

- $L_i \leq t_{j^*} + \frac{1}{m} \sum_j t_j \leq L^* + L^* = 2L^*$

Fact 1

Fact 2

# Assignment Project Exam Help

# Makespan

Add WeChat powcoder

- Theorem [Graham 1966]

- Regardless of the order, greedy gives a 2-approximation.

- Is our analysis tight?

## Assignment Project Exam Help

- Essentially.
- By averaging over  $k \neq i$  in the previous slide, one can show a slightly better  $2 - 1/m$  approximation
- There is an example where greedy has approximation as bad as  $2 - 1/m$
- So  $2 - 1/m$  is exactly tight.

<https://powcoder.com>

Add WeChat powcoder

# Assignment Project Exam Help

# Makespan

Add WeChat powcoder

- Tight example:

- $m(m - 1)$  jobs of length 1, followed by one job of length  $m$
- Greedy evenly distributes unit length jobs on all  $m$  machines, and assigning the last heavy job makes makespan  $m - 1 + m = 2m - 1$
- Optimal makespan is  $m$  by evenly distributing unit length jobs among  $m - 1$  machines and putting the single heavy job on the remaining

Add WeChat powcoder

- Idea:

- It seems keeping heavy jobs at the end is bad.
- So let's just start with them first!

# Assignment Project Exam Help

# Makespan Revisited

Add WeChat powcoder

- Greedy LPT (Longest Processing Time First)
  - Run the greedy algorithm but consider jobs in a non-increasing order of their processing time
  - Suppose  $t_1 \geq t_2 \geq \dots \geq t_n$
- Fact 3: If the bottleneck machine  $i$  has only one job  $j$ , then the solution is optimal.
  - Current solution has  $L = L_i = t_j$
  - We know  $L^* \geq t_j$  from Fact 1
- Fact 4: If there are more than  $m$  jobs, then  $L^* \geq 2 \cdot t_{m+1}$ 
  - The first  $m + 1$  jobs each have processing time at least  $t_{m+1}$
  - By the pigeonhole principle, the optimal solution must put at least two of them on the same machine

# Assignment Project Exam Help

# Makespan Revisited

Add WeChat powcoder

- Theorem

- Greedy LPT achieves  $3/2$ -approximation

- Proof: Assignment Project Exam Help

- Similar to the proof for arbitrary ordering
- Consider a bottleneck machine  $i$  and the job  $j^*$  that was last scheduled on this machine by the greedy algorithm
- Case 1: Machine  $i$  has only one job  $j^*$ 
  - By Fact 3, greedy is optimal in this case (i.e. 1-approximation)

# Assignment Project Exam Help

# Makespan Revisited

Add WeChat powcoder

- Theorem

- Greedy LPT achieves  $3/2$ -approximation

- Proof: Assignment Project Exam Help

- Similar to the proof for arbitrary ordering
- Consider a bottleneck machine  $i$  and the job  $j^*$  that was last scheduled on this machine by the greedy algorithm
- Case 2: Machine  $i$  has at least two jobs

- Job  $j^*$  must have  $t_{j^*} \leq t_{m+1}$

- As before,  $L = L_i = (L_i - t_{j^*}) + t_{j^*} \leq 1.5 L^*$

Same as before

$\leq L^*$

$\leq L^*/2$

$t_{j^*} \leq t_{m+1}$  and Fact 4

# Assignment Project Exam Help

# Makespan Revisited

Add WeChat powcoder

- Theorem

- Greedy LPT achieves  $3/2$ -approximation
- Is our analysis tight? No!

Assignment Project Exam Help

- Theorem [Graham 1966]

- Greedy LPT achieves  $\left(\frac{4}{3} - \frac{1}{3m}\right)$ -approximation
- Is Graham's approximation tight?

<https://powcoder.com>

Add WeChat powcoder

- Yes.

- In the upcoming example, greedy LPT is as bad as  $\frac{4}{3} - \frac{1}{3m}$

# Makespan Revisited

- Tight example for Greedy LPT:

- 2 jobs each of lengths  $m, m + 1, \dots, 2m - 1$

- One more job of length  $m$

- Greedy-LPT has makespan  $4m - 1$  (verify!)

- OPT has makespan  $3m$  (verify!)

- Thus, approximation ratio is at least as bad as  $\frac{4m-1}{3m} = \frac{4}{3} - \frac{1}{3m}$

Assignment Project Exam Help

Add WeChat powcoder

Assignment Project Exam Help  
**Weighted Set Packing**  
<https://powcoder.com>

Add WeChat powcoder

# Assignment Project Exam Help

# Weighted Set Packing

Add WeChat powcoder

- Problem

- **Input:** Universe of  $m$  elements, sets  $S_1, \dots, S_n$  with values  $v_1, \dots, v_n \geq 0$
- **Output:** Pick disjoint sets with maximum total value
  - That is, pick  $W \subseteq \{1, \dots, n\}$  to maximize  $\sum_{i \in W} v_i$  subject to  $S_i \cap S_j = \emptyset$  for all  $i, j \in W$

<https://powcoder.com>

- What's known about this problem?
  - It's NP-hard
  - For any constant  $\epsilon > 0$ , you cannot get  $O(m^{1/2-\epsilon})$  approximation in polynomial time unless  $NP=ZPP$  (widely believed to be not true)

# Assignment Project Exam Help

# Greedy Template

Add WeChat powcoder

- Sort the sets in some order, consider them one-by-one, and take any set that you can along the way.

## Assignment Project Exam Help

- Greedy Algorithm:
  - Sort the sets in a specific order.
  - Relabel them as  $1, 2, \dots, n$  in this order.
  - $W \leftarrow \emptyset$
  - For  $i = 1, \dots, n$ :
    - If  $S_i \cap S_j = \emptyset$  for every  $j \in W$ , then  $W \leftarrow W \cup \{i\}$
  - Return  $W$ .

# Assignment Project Exam Help

## Greedy Algorithm

Add WeChat powcoder

- What order should we sort the sets by?
- We want to take sets with high values.
  - $v_1 \geq v_2 \geq \dots \geq v_n$ ? Only  $m$ -approximation ☹️
- We don't want to exhaust many items too soon.
  - $\frac{v_1}{|S_1|} \geq \frac{v_2}{|S_2|} \geq \dots \geq \frac{v_n}{|S_n|}$ ? Also  $m$ -approximation ☹️
- $\sqrt{m}$ -approximation :  $\frac{v_1}{\sqrt{|S_1|}} \geq \frac{v_2}{\sqrt{|S_2|}} \geq \dots \geq \frac{v_n}{\sqrt{|S_n|}}$  ?

[Lehmann et al. 2011]

# Assignment Project Exam Help

# Proof of Approximation

Add WeChat powcoder

- Definitions

- $OPT$  = Some optimal solution
- $W$  = Solution returned by our greedy algorithm
- For  $i \in W$ ,  $OPT_i = \{j \in OPT : j \geq i, S_i \cap S_j \neq \emptyset\}$

- Claim 1:  $OPT \subseteq \bigcup_{i \in W} OPT_i$

- Claim 2: It is enough to show that  $\forall i \in W$   
$$\sqrt{m} \cdot v_i \geq \sum_{j \in OPT_i} v_j$$

- Observation: For  $j \in OPT_i$ ,  $v_j \leq v_i \cdot \frac{\sqrt{|S_j|}}{\sqrt{|S_i|}}$

# Proof of Approximation

- Summing over all  $j \in OPT_i$  :

$$\sum_{j \in OPT_i} v_j \leq \frac{v_i}{\sqrt{|S_i|}} \cdot \sum_{j \in OPT_i} \sqrt{|S_j|}$$

<https://powcoder.com>

- Using Cauchy-Schwarz ( $\sum_i x_i y_i \leq \sqrt{\sum_i x_i^2} \cdot \sqrt{\sum_i y_i^2}$ )

$$\begin{aligned} \sum_{j \in OPT_i} \sqrt{1 \cdot |S_j|} &\leq \sqrt{|OPT_i|} \cdot \sqrt{\sum_{j \in OPT_i} |S_j|} \\ &\leq \sqrt{|S_i|} \cdot \sqrt{m} \end{aligned}$$

# Unweighted Vertex Cover

Add WeChat powcoder

GREEDY-VERTEX-COVER( $G$ )

---

$S \leftarrow \emptyset$ .

$E' \leftarrow E$ .

WHILE ( $E' \neq \emptyset$ )

<https://powcoder.com> every vertex cover must take at least one of these; we take both

Let  $(u, v) \in E'$  be an arbitrary edge.

$M \leftarrow M \cup \{(u, v)\}$ .  $\leftarrow M$  is a matching

$S \leftarrow S \cup \{u\} \cup \{v\}$ .

Delete from  $E'$  all edges incident to either  $u$  or  $v$ .

RETURN  $S$ .

# Assignment Project Exam Help

# Unweighted Vertex Cover

Add WeChat powcoder

- **Theorem:**

- Greedy edge-selection algorithm for unweighted vertex cover achieves 2-approximation.

## Assignment Project Exam Help

- **Observation 1:**

- For any vertex cover  $S^*$  and any matching  $M$ ,  $|S^*| \geq |M|$ , where  $|M|$  = number of edges in  $M$

- **Proof:**  $S^*$  must contain at least one endpoint of each edge in  $M$

- **Observation 2:**

- Greedy algorithm finds a vertex cover of size  $|S| = 2 \cdot |M|$

- Hence,  $|S| \leq 2 \cdot |S^*|$ , where  $S^*$  = min vertex cover

# Assignment Project Exam Help

# Unweighted Vertex Cover

Add WeChat powcoder

- Corollary:

- If  $M^*$  is a *maximum* matching, and  $M$  is a *maximal* matching, then
$$|M| \geq \frac{1}{2} |M^*|$$

- Proof: Assignment Project Exam Help

- By design,  $|M| = \frac{1}{2} |S|$   
<https://powcoder.com>
- $|S| \geq |M^*|$  (Observation 1)
- Hence,  $|M| \geq \frac{1}{2} |M^*|$  ■ Add WeChat powcoder

- This greedy algorithm is also a 2-approximation to the problem of finding a maximum cardinality matching
  - However, the max cardinality matching problem can be solved exactly in polynomial time using a more complex algorithm

# Assignment Project Exam Help

# Unweighted Vertex Cover

Add WeChat powcoder

- What about a greedy vertex selection algorithm?
    - Start with  $S = \emptyset$
    - While  $S$  is not a vertex cover:
      - Choose a vertex  $v$  which maximizes the number of uncovered edges incident on it
      - Add  $v$  to  $S$
    - Gives  $O(\log d_{\max})$  approximation, where  $d_{\max}$  is the maximum degree of any vertex
      - But unlike the edge-selection version, this generalizes to set cover
      - For set cover,  $O(\log d_{\max})$  approximation ratio is the best possible in polynomial time unless  $P=NP$

On the Hardness of Approximating Minimum Vertex Cover

<https://powcoder.com>

Irit Dinur\*

Samuel Safra†

May 26, 2004

### Abstract

We prove the Minimum Vertex Cover problem to be NP-hard to approximate to within a factor of 1.3606, extending on previous PCP and hardness of approximation technique. To that end, one needs to develop a new proof framework, and borrow and extend ideas from several fields.

# Assignment Project Exam Help

# Unweighted Vertex Cover

Add WeChat powcoder

NOT IN SYLLABUS

- Theorem [Khot-Regev 2008]:
  - Unless the “unique games conjecture” is violated, there is no polynomial-time  $\rho$ -approximation algorithm for unweighted vertex cover for any constant  $\rho < 2$ .

Assignment Project Exam Help

<https://powcoder.com>

Vertex Cover Might be Hard to Approximate to within  $2 - \epsilon$

Add WeChat powcoder

Subhash Khot \*

Oded Regev †

## Abstract

Based on a conjecture regarding the power of unique 2-prover-1-round games presented in [Khot02], we show that vertex cover is hard to approximate within any constant factor better than 2. We actually show a stronger result, namely, based on the same conjecture, vertex cover on  $k$ -uniform hypergraphs is hard to approximate within any constant factor better than  $k$ .

# Assignment Project Exam Help

# Unweighted Vertex Cover

Add WeChat powcoder

NOT IN SYLLABUS

- How does one prove a lower bound on the approximation ratio of any polynomial-time algorithm?
  - We prove that if there is a polynomial-time  $\rho$ -approximation algorithm for the problem with  $\rho <$  some bound, then some widely believed conjecture is violated
  - For example, we can prove that given a polynomial time  $\rho$ -approximation algorithm to vertex cover for any constant  $\rho < 1.3606$ , we can use this algorithm as a subroutine to solve the 3SAT decision problem in polynomial time, implying P=NP
  - Similar technique can be used to reduce from other widely believed conjectures, which may give different (sometimes better) bounds
  - Beyond the scope of this course

Add WeChat powcoder

# Assignment Project Exam Help

## ILP Formulation

- For each vertex  $v$ , create a binary variable  $x_v \in \{0,1\}$  indicating whether vertex  $v$  is chosen in the vertex cover
- Then, computing min weight vertex cover is equivalent to solving the following integer linear program

$$\min \sum_v w_v \cdot x_v$$

subject to

$$x_u + x_v \geq 1, \quad \forall (u, v) \in E$$

$$x_v \in \{0,1\}, \quad \forall v \in V$$

# Assignment Project Exam Help

## LP Relaxation

Add WeChat powcoder

- What if we solve the “LP relaxation” of the original ILP?
  - Just convert all integer variables to real variables

ILP with binary variables      LP with real variables

$$\min \sum_v w_v \cdot x_v$$

subject to

$$x_u + x_v \geq 1, \quad \forall (u, v) \in E$$

$$x_v \in \{0, 1\}, \quad \forall v \in V$$

$$\min \sum_v w_v \cdot x_v$$

subject to

$$x_u + x_v \geq 1, \quad \forall (u, v) \in E$$

$$x_v \geq 0, \quad \forall v \in V$$

# Assignment Project Exam Help

## Rounding LP Solution

Add WeChat powcoder

- What if we solve the “LP relaxation” of the original ILP?
  - Let's say we are minimizing objective  $c^T x$
  - Since the LP minimizes this over a larger feasible space than the ILP, optimal LP objective value  $\leq$  optimal ILP objective value
  - Let  $x_{LP}^*$  be an optimal LP solution (which we can compute efficiently) and  $x_{ILP}^*$  be an optimal ILP solution (which we can't compute efficiently)
    - $c^T x_{LP}^* \leq c^T x_{ILP}^*$
    - But  $x_{LP}^*$  may have non-integer values
    - Efficiently round  $x_{LP}^*$  to an ILP feasible solution  $\hat{x}$  without increasing the objective too much
    - If we prove  $c^T \hat{x} \leq \rho \cdot c^T x_{LP}^*$ , then we will also have  $c^T \hat{x} \leq \rho \cdot c^T x_{ILP}^*$
    - Thus, our algorithm will achieve  $\rho$ -approximation

# Assignment Project Exam Help

## Rounding LP Solution

Add WeChat powcoder

- What if we solve the “LP relaxation” of the original ILP?

- If we are maximizing  $c^T x$  instead of minimizing, then it's reversed:

- Optimal LP objective value  $\geq$  optimal ILP objective value, i.e.,  
$$c^T x_{LP}^* \geq c^T x_{ILP}^*$$

<https://powcoder.com>

- Efficiently round  $x_{LP}^*$  to an ILP feasible solution  $\hat{x}$  without decreasing the objective too much

- If we prove  $c^T \hat{x} \geq (1/\rho) \cdot c^T x_{LP}^*$ , then  $c^T \hat{x} \geq (1/\rho) \cdot c^T x_{ILP}^*$

- Thus, our algorithm will achieve  $\rho$ -approximation

# Assignment Project Exam Help

## Weighted Vertex Cover

**ILP with binary variables**

$$\min \sum_v w_v \cdot x_v$$

subject to

$$\begin{aligned} x_u + x_v &\geq 1, & \forall (u, v) \in E \\ x_v &\in \{0, 1\}, & \forall v \in V \end{aligned}$$

**LP with real variables**

$$\min \sum_v w_v \cdot x_v$$

subject to

$$\begin{aligned} x_u + x_v &\geq 1, & \forall (u, v) \in E \\ x_v &\geq 0, & \forall v \in V \end{aligned}$$

# Assignment Project Exam Help General LP Relaxation Strategy

- Your NP-complete problem amounts to solving
  - Max  $c^T x$  subject to  $Ax \leq b, x \in \mathbb{N}$  (need not be binary)

- Instead, solve:

- Max  $c^T x$  subject to  $Ax \leq b, x \in \mathbb{R}_{\geq 0}$  (LP relaxation)
  - LP optimal value  $\geq$  ILP optimal value (for maximization)
- $x^*$  = LP optimal solution
- Round  $x^*$  to  $\hat{x}$  such that  $c^T \hat{x} \geq \frac{c^T x^*}{\rho} \geq \frac{\text{ILP optimal value}}{\rho}$
- Gives  $\rho$ -approximation
  - **Info:** Best  $\rho$  you can hope to get via this approach for a particular LP-ILP combination is called the *integrality gap*

Local Search Paradigm  
<https://powcoder.com>

Add WeChat powcoder

# Assignment Project Exam Help

## Local Search

Add WeChat powcoder

- Heuristic paradigm

- Sometimes it might provably return an optimal solution
- But even if not, it might give a good approximation

Assignment Project Exam Help

- Template

- Start with some initial feasible solution  $S$
- While there is a “better” solution  $S'$  in the **local neighborhood** of  $S$
- Switch to  $S'$

<https://powcoder.com>

Add WeChat powcoder

- Need to define:

- Which initial feasible solution should we start from?
- What is “better”?
- What is “local neighborhood”?

# Assignment Project Exam Help

## Local Search

Add WeChat powcoder

- For some problems, local search provably returns an optimal solution
- Example: network flow
  - Initial solution: zero flow
  - Local neighborhood: all flows that can be obtained by augmenting the current flow along a path in the residual graph
  - Better: Higher flow value
- Example: LP via simplex
  - Initial solution: a vertex of the polytope
  - Local neighborhood: neighboring vertices
  - Better: better objective value

# Assignment Project Exam Help

## Local Search

Add WeChat powcoder

- But sometimes it doesn't return an optimal solution, and "gets stuck" in a local maxima

Assignment Project Exam Help

<https://powcoder.com>

Add WeChat powcoder

# Assignment Project Exam Help

## Local Search

Add WeChat powcoder

- In that case, we want to bound the worst-case ratio between the global optimum and the worst local optimum (the worst solution that local search might return)

Assignment Project Exam Help

**Max-Cut**

<https://powcoder.com>

Add WeChat powcoder

# Max-Cut

Add WeChat powcoder

- Problem

- **Input:** An undirected graph  $G = (V, E)$
- **Output:** A partition  $(A, B)$  of  $V$  that maximizes the number of edges going across the cut, i.e., maximizes  $|E'|$  where  $E' = \{(u, v) \in E \mid u \in A, v \in B\}$

<https://powcoder.com>

- This is also known to be an NP-hard problem

Add WeChat powcoder

- What is a natural local search algorithm for this problem?
  - Given a current partition, what small change can you do to improve the objective value?

# Max-Cut

Add WeChat powcoder

- Local Search

- Initialize  $(A, B)$  arbitrarily.
- While there is a vertex  $u$  such that moving  $u$  to the other side improves the objective value:
  - Move  $u$  to the other side.

Assignment Project Exam Help

<https://powcoder.com>

Add WeChat powcoder

- When does moving  $u$ , say from  $A$  to  $B$ , improve the objective value?
  - When  $u$  has more incident edges going within the cut than across the cut, i.e., when  $|\{(u, v) \in E \mid v \in A\}| > |\{(u, v) \in E \mid v \in B\}|$

# Max-Cut

Add WeChat powcoder

- Local Search

- Initialize  $(A, B)$  arbitrarily.
- While there is a vertex  $u$  such that moving  $u$  to the other side improves the objective value:
  - Move  $u$  to the other side.

Assignment Project Exam Help

<https://powcoder.com>

Add WeChat powcoder

- Why does the algorithm stop?
  - Every iteration increases the number of edges across the cut by at least 1, so the algorithm must stop in at most  $|E|$  iterations

# Max-Cut

Add WeChat powcoder

- Local Search

- Initialize  $(A, B)$  arbitrarily.
- While there is a vertex  $u$  such that moving  $u$  to the other side improves the objective value:
  - Move  $u$  to the other side.

Assignment Project Exam Help

<https://powcoder.com>

Add WeChat powcoder

- Approximation ratio?

- At the end, every vertex has at least as many edges going across the cut as within the cut
- Hence, at least half of all edges must be going across the cut
  - **Exercise:** Prove this formally by writing equations.

# Assignment Project Exam Help

## Weighted Max-Cut

Add WeChat powcoder

- Variant

- Now we're given integral edge weights  $w: E \rightarrow \mathbb{N}$
- The goal is to maximize the total *weight* of edges going across the cut

Assignment Project Exam Help

- Algorithm <https://powcoder.com>

- The same algorithm works...
- But we move  $u$  to the other side if the total *weight* of its incident edges going within the cut is greater than the total *weight* of its incident edges going across the cut

# Assignment Project Exam Help

## Weighted Max-Cut

Add WeChat powcoder

- Number of iterations?

- **Unweighted case:** #edges going across the cut must increase by at least 1, so it takes at most  $|E|$  iterations

## Assignment Project Exam Help

- **Weighted case:** total *weight* of edges going across the cut must increase by at least 1, but this could take up to  $\sum_{e \in E} w_e$  iterations, which can be *exponential* in the input length
  - There are examples where the local search actually takes exponentially many steps
  - **Fun exercise:** Design an example where the number of iterations is exponential in the input length.

# Assignment Project Exam Help

# Weighted Max-Cut

Add WeChat powcoder

- Number of iterations?

- But we can find a  $2 + \epsilon$  approximation in time polynomial in the input length and  $\frac{1}{\epsilon}$

Assignment Project Exam Help

- The idea is to only move vertices when it “sufficiently improves” the objective value

<https://powcoder.com>

Add WeChat powcoder

# Assignment Project Exam Help

## Weighted Max-Cut

Add WeChat powcoder

- Better approximations?

- Theorem [Goemans-Williamson 1995]:

There exists a polynomial time algorithm for max-cut with approximation ratio  $\frac{2}{\pi} \cdot \min_{0 \leq \theta \leq \pi} \frac{\theta}{1 - \cos \theta} \approx 0.878$

<https://powcoder.com>

- Uses “semidefinite programming” and “randomized rounding”

- **Note:** The literature from here on uses approximation ratios  $\leq 1$ , so we will follow that convention in the remaining slides.

- Assuming the unique games conjecture, this approximation ratio is tight

**Exact Max- $k$ -SAT**  
<https://powcoder.com>

Add WeChat powcoder

# Assignment Project Exam Help

## Exact Max- $k$ -SAT

Add WeChat powcoder

- Problem

- **Input:** An exact  $k$ -SAT formula  $\varphi = C_1 \wedge C_2 \wedge \cdots \wedge C_m$ , where each clause  $C_i$  has exactly  $k$  literals, and a weight  $w_i \geq 0$  of each clause  $C_i$ .
- **Output:** A truth assignment  $\tau$  maximizing the total weight of clauses satisfied under  $\tau$ .

<https://powcoder.com>

- Let us denote by  $W(\tau)$  the total weight of clauses satisfied under  $\tau$ .
- What is a good definition of “local neighborhood”?

# Assignment Project Exam Help

## Exact Max- $k$ -SAT

Add WeChat powcoder

- Local neighborhood:
  - $N_d(\tau)$  = set of all truth assignments  $\tau'$  which differ from  $\tau$  in the values of at most  $d$  variables

## Assignment Project Exam Help

- **Theorem:** The local search with  $d = 1$  gives a  $2/3$  approximation to Exact Max-2-SAT.
- <https://powcoder.com>

Add WeChat powcoder

# Assignment Project Exam Help

## Exact Max- $k$ -SAT

Add WeChat powcoder

- **Theorem:** The local search with  $d = 1$  gives a  $2/3$  approximation to Exact Max-2-SAT.

- **Proof:**

- Let  $\tau$  be a local optimum

- $S_0$  = set of clauses not satisfied under  $\tau$
    - $S_1$  = set of clauses from which exactly one literal is true under  $\tau$
    - $S_2$  = set of clauses from which both literals are true under  $\tau$
    - $W(S_0), W(S_1), W(S_2)$  be the corresponding total weights

- **Goal:**  $W(S_1) + W(S_2) \geq 2/3 \cdot (W(S_0) + W(S_1) + W(S_2))$ 
      - Equivalently,  $W(S_0) \leq 1/3 \cdot (W(S_0) + W(S_1) + W(S_2))$

# Assignment Project Exam Help

## Exact Max- $k$ -SAT

Add WeChat powcoder

- **Theorem:** The local search with  $d = 1$  gives a  $2/3$  approximation to Exact Max-2-SAT.
- **Proof:**
  - We say that clause  $C$  “involves” variable  $j$  if it contains  $x_j$  or  $\bar{x}_j$
  - $A_j$  = set of clauses in  $S_0$  involving variable  $j$ 
    - Let  $W(A_j)$  be the total weight of such clauses
  - $B_j$  = set of clauses in  $S_1$  involving variable  $j$  such that it is the literal of variable  $j$  that is true under  $\tau$ 
    - Let  $W(B_j)$  be the total weight of such clauses

# Assignment Project Exam Help

## Exact Max- $k$ -SAT

Add WeChat powcoder

- **Theorem:** The local search with  $d = 1$  gives a  $\frac{2}{3}$  approximation to Exact Max-2-SAT.

- **Proof:**

- $2 W(S_0) = \sum_j W(A_j)$

- Every clause in  $S_0$  is counted twice on the RHS

- $W(S_1) = \sum_j W(B_j)$

- Every clause in  $S_1$  is only counted once on the RHS for the variable whose literal was true under  $\tau$

- For each  $j : W(A_j) \leq W(B_j)$

- From local optimality of  $\tau$ , since otherwise flipping the truth value of variable  $j$  would have increased the total weight

# Assignment Project Exam Help

## Exact Max- $k$ -SAT

Add WeChat powcoder

- **Theorem:** The local search with  $d = 1$  gives a  $\frac{2}{3}$  approximation to Exact Max-2-SAT.

- **Proof:**

- $2 W(S_0) \leq W(S_1)$

- Summing the third equation on the last slide over all  $j$ , and then using the first two equations on the last slide

- Hence:

- $3 W(S_0) \leq W(S_0) + W(S_1) \leq W(S_0) + W(S_1) + W(S_2)$
    - Precisely the condition we wanted to prove...
    - QED!

# Assignment Project Exam Help

## Exact Max- $k$ -SAT

Add WeChat powcoder

- Higher  $d$ ?

- Searches over a larger neighborhood
- May get a better approximation ratio, but increases the running time as we now need to check if any neighbor in a large neighborhood provides a better objective

<https://powcoder.com>

- The bound is still  $2/3$  for  $d = o(n)$
- For  $d = \Omega(n)$ , the neighborhood size is exponential
- But the approximation ratio is...
  - At most  $4/5$  with  $d < n/2$
  - 1 (i.e. optimal solution is always reached) with  $d = n/2$

# Assignment Project Exam Help

## Exact Max- $k$ -SAT

Add WeChat powcoder

- Better approximation ratio?

- We can learn something from our proof
- Note that we did not use anything about  $W(S_2)$ , and simply added it at the end

- If we could also guarantee that  $W(S_0) \leq W(S_2)$ ...
  - Then we would get  $4 W(S_0) \leq W(S_0) + W(S_1) + W(S_2)$ , which would give a  $\frac{3}{4}$  approximation

- Result (without proof):

- This can be done by including just one more assignment in the neighborhood:  $N(\tau) = N_1(\tau) \cup \{\tau^c\}$ , where  $\tau^c$  = complement of  $\tau$

# Assignment Project Exam Help

## Exact Max- $k$ -SAT

Add WeChat powcoder

- What if we do not want to modify the neighborhood?
  - A slightly different tweak also works
  - We want to weigh clauses in  $W(S_2)$  more because when we get a clause through  $S_2$  we get more robustness (it can withstand changes in single variables)

<https://powcoder.com>

- Modified local search:
  - Start at arbitrary  $\tau$
  - While there is an assignment in  $N_1(\tau)$  that improves the potential  $1.5 W(S_1) + 2 W(S_2)$ 
    - Switch to that assignment

# Assignment Project Exam Help

## Exact Max- $k$ -SAT

Add WeChat powcoder

- Modified local search:

- Start at arbitrary  $\tau$
- While there is an assignment in  $N_1(\tau)$  that improves the potential  $1.5 W(S_1) + 2 W(S_2)$ 
  - Switch to that assignment

<https://powcoder.com>

- Note:

- This is the first time that we're using a definition of “better” in local search paradigm that does not quite align with the ultimate objective we want to maximize
- This is called “non-oblivious local search”

# Assignment Project Exam Help

## Exact Max- $k$ -SAT

Add WeChat powcoder

- Modified local search:

- Start at arbitrary  $\tau$
- While there is an assignment in  $N_1(\tau)$  that improves the potential  $1.5 W(S_1) + 2 W(S_2)$ 
  - Switch to that assignment

<https://powcoder.com>

- Result (without proof):

- Modified local search gives  $3/4$ -approximation to Exact Max-2-SAT

# Assignment Project Exam Help

## Exact Max- $k$ -SAT

Add WeChat powcoder

- More generally:
    - The same technique works for higher values of  $k$
    - Gives  $\frac{2^k - 1}{2^k}$  approximation for Exact Max- $k$ -SAT
      - In the next lecture, we will achieve the same approximation ratio much more easily through a different technique
  - Note: This ratio is  $\frac{7}{8}$  for Exact Max-3-SAT
    - Theorem [Håstad]: Achieving  $\frac{7}{8} + \epsilon$  approximation where  $\epsilon > 0$  is NP-hard.
      - Uses PCP (probabilistically checkable proofs) technique
- <https://powcoder.com>
